- It is also possible that Satoshi Nakamoto could be a group of people and not just a single individual.
- In the early days of ***Bitcoin***, Satoshi Nakamoto was quite active in the community, answering questions and helping to troubleshoot issues. However, he/she/they abruptly disappeared in 2011 and has not been heard from since.
- Satoshi Nakamoto's true identity has been the subject of much speculation, with several people claiming to be the real Satoshi over the years. However, none of these claims have been conclusively proven.

While Satoshi was the primary architect behind ***Bitcoin***, they didn't work alone. There was undoubtedly great input and assistance from influential figures in tech and cryptography, including Wei Dai and Nick Szabo.

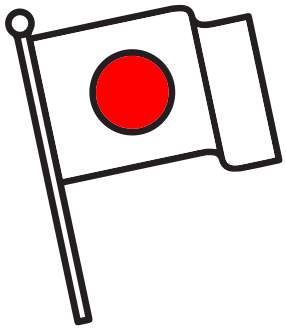
Despite facing challenges such as technical issues and skepticism from the community, his creation inspired the development of many other technologies and gained widespread adoption. Even with the controversies it has faced, bitcoin remains king in a world of cryptocurrencies. Satoshi's last known message was a reassurance that the project was "in good hands" with software developer Gavin Andresen.

Bitcoin Conspiracy and Mystery

Bitcoin is the brainchild of a mysterious unknown person or group known as **'Satoshi Nakamoto'**.

To this day, nobody knows who the person(s) behind ***Bitcoin*** is.

In Japanese



- "*Satoshi*" translates into "clear-thinking; quick-witted; wise."
- "*Naka*" can mean "inside" or "relationship".
- "*Moto*" is defined as the origin; the cause; the foundation; the basis."

Because of this, some believe that the translation points to ***Bitcoin*** being created by the CIA (Central Intelligence Agency).

Yet more conspiracy theorists believe that four companies are behind things:

Satoshi = **Sa**msung & **Toshi**ba
Nakamoto = **Naka**michi **& Moto**rola

There's more work to do on DoS, but I'm doing a quick build of what I have so far in case it's needed, before venturing into more complex ideas. The build for this is version 0.3.19.

- Added some DoS controls
As Gavin and I have said clearly before, the software is not at all resistant to DoS attack. This is one improvement, but there are still more ways to attack than I can count.

I'm leaving the -limitfreerelay part as a switch for now and it's there if you need it.

- Removed "safe mode" alerts
"safe mode" alerts was a temporary measure after the 0.3.9 overflow bug. We can say all we want that users can just run with "-disablesafemode", but it's better just not to have it for the sake of appearances. It was never intended as a long term feature. Safe mode can still be triggered by seeing a longer (greater total PoW) invalid block chain.
